Fullstack Software Engineer with 3+ years experience building consumer and enterprise web applications across the full stack, with a Fine Art and Design background that informs strong UX instincts and a bias toward ownership from design through deployment.

TypeScript • React • Node.js • PostgreSQL • Redux • Redux Toolkit • Tailwind • Swift • React Native • C# • .NET
• Entity Framework Core • RESTful APIs • Figma • Agile • CI/CD • Git • Jira • a11y / WCAG

Experience

Olio Apps

Remote

Fullstack Software Engineer

Sept 2023 – May 2026

Built and shipped fullstack web applications for clients ranging from small businesses to Fortune 5 enterprise companies, including multi-year embedded engagement with Apptio (an IBM company). Consistently took ownership of features end-to-end, moving from design requirements through production deployment. Accelerated delivery for health industry clients using agentic tooling including Claude and Cursor.

Projects

Earplanes

Jan – March 2024

React Native, Swift, Xcode, Java, Tailwind

Developed a barometric pressure quantizer in Swift for a shipped iOS health app that monitored cabin pressure changes during flights to alert users with sensitive eardrums when to use protective earplugs. Diagnosed and resolved a critical iOS crash occurring on long-haul flights (14+ hours) caused by storing altimeter readings every 5 seconds. Implemented a quantizer aggregating data across every 50 samples, reducing memory load while preserving graph fidelity.

Apex Shell

Apptio

Apr – June 2024

React, Typescript, Piral, webpack, IBM Carbon Design System

Evaluated and converted a legacy shell UI into a webpack-ready micro-frontend shell serving as the load-bearing architecture for Apptio's suite of enterprise IT financial management products, used by over 1,800 organizations including 60% of the Fortune 100. Engineered elements allowing pilets to inject UI into the shell and connected login, logout, and account portals. Delivered a complete UI and module builder update within two months.

SSO and Trusted Issuer Configuration

Apptio (Frontdoor)

June – Oct 2024

React, TypeScript, React Router, Tanstack, Axios, Java (DTO), Playwright, Swagger, Agile

Designed and built an enterprise-grade user flow enabling IT administrators at Fortune 100 organizations to create SSO connections, upgrade legacy connections, and configure trusted issuers. Collaborated with the Java backend team to clarify API contracts and interpret Java DTOs established a year prior to the UI work. Delivered two fully built pages with CRUD functionality, AG Grid components, configurable grid cells, and dynamically rendered content. Coordinated with UX to resolve design requirements and communicate API limitations.

Cost Transparency

Apptio	Jan – Dec 2025
<i>Rush, monorepo, React, TypeScript, functional programming, React Query, Highcharts, AG Grid</i>	
Designed a standalone compatibility package enabling users to dynamically switch between Table, Bar, Column, Stacked variations, Line and Pie charts, enabling the visualization layer enterprise finance teams use to interpret \$650B in technology spend, with all data and formatting props persisting across swaps. Owned the spec, technical design doc, stakeholder sign-off, and GA release. Built a Bubble Chart component using Highcharts, with custom SVG legend behavior, on-render event handling for deeply nested objects, and custom testing utilities achieving 100% test coverage. Designed a recursive style resolution function for text-color inheritance across chart components, reducing styling inconsistencies across all chart types. Audited and commonized duplicated logic across Cartesian chart format panel implementations.	
TeamCity CI/CD Pipeline Migration	
Apptio	Nov 2024 – Jan 2025
<i>Bash, Gradle, Docker, GitHub Actions, TeamCity, YAML, Kotlin, Java, Scripts</i>	
Spearheaded the conversion of 28 build steps spanning Bash, Gradle, and Java scripts from TeamCity to GitHub Actions as part of a phased deprecation plan. Developed diagrams and migration plans in coordination with team leads. Engineered automated and manual build triggers for a legacy Java backend system with average build times of four hours, devising an efficient sequencing strategy to address lengthy build times.	
OneFlo	Feb – April 2026
<i>TypeScript, Node.js, Prisma, AWS, Twilio, React, Agentic Tooling (Cursor), LLM APIs (Claude)</i>	
Designed and implemented backend algorithms and database calls to feed structured and scrubbed JSON discharge notes into an LLM API, determining patient discharge location and auto-tagging discharge types to drive AI agent behavior. Developed contact prioritization and phone validation algorithms producing an ordered contact list consumed by an AI agent via SMS outreach. Navigated third-party API contracts from healthcare providers. Delivered production-ready systems analyzing 40+ patients daily, replacing a manual morning discharge review process and enabling the company to safely process hundreds of patients per week at scale.	
Throwback Derby	Jan – March 2024
<i>TypeScript, Node.js, PostgreSQL, React Native, Redux, Redux Toolkit, GCP, Firebase</i>	
Architected and built the entire backend logic for a VR baseball game's leaderboard system — designing the data model, building the Node.js/Postgres backend, and owning the system end-to-end from schema to deployment on GCP. Designed and built a standalone React Native leaderboard app for VR players to track scores across a range of filters, using Redux and Redux Toolkit for state management and Firebase for real-time data sync.	

Education	
Epicodus	Portland, OR
Certificate in Fullstack Software Development	March – Sept 2023
Oregon College of Art and Craft	Portland, OR
MFA	Aug 2016 – May 2018
Goshen College	Goshen, IN
BA in Art, Environmental Science, and Social Policy	Aug 2010 – May 2014
